

WMO Regional Conference of the Regional Association VI on the Role of National Meteorological and Hydrological Services: Leadership and Innovation
Geneva, Switzerland, 3 November 2022

ESSLs' European Severe Weather Database (ESWD) – its manifold uses as an example of citizen science and NGO participation

Alois M. Holzer
ESSL Director of Operations

IF4 Tornado in Hodonín, Czechia, on 24 June 2021

European Severe Weather Database

- pan-European database of severe weather reports
- collected and quality-controlled by ESSL and partners
- as of today, contains more than 310,000 severe weather reports
- for event types typically not well-covered by conventional weather or climate station reports

Photo: Alois M. Holzer

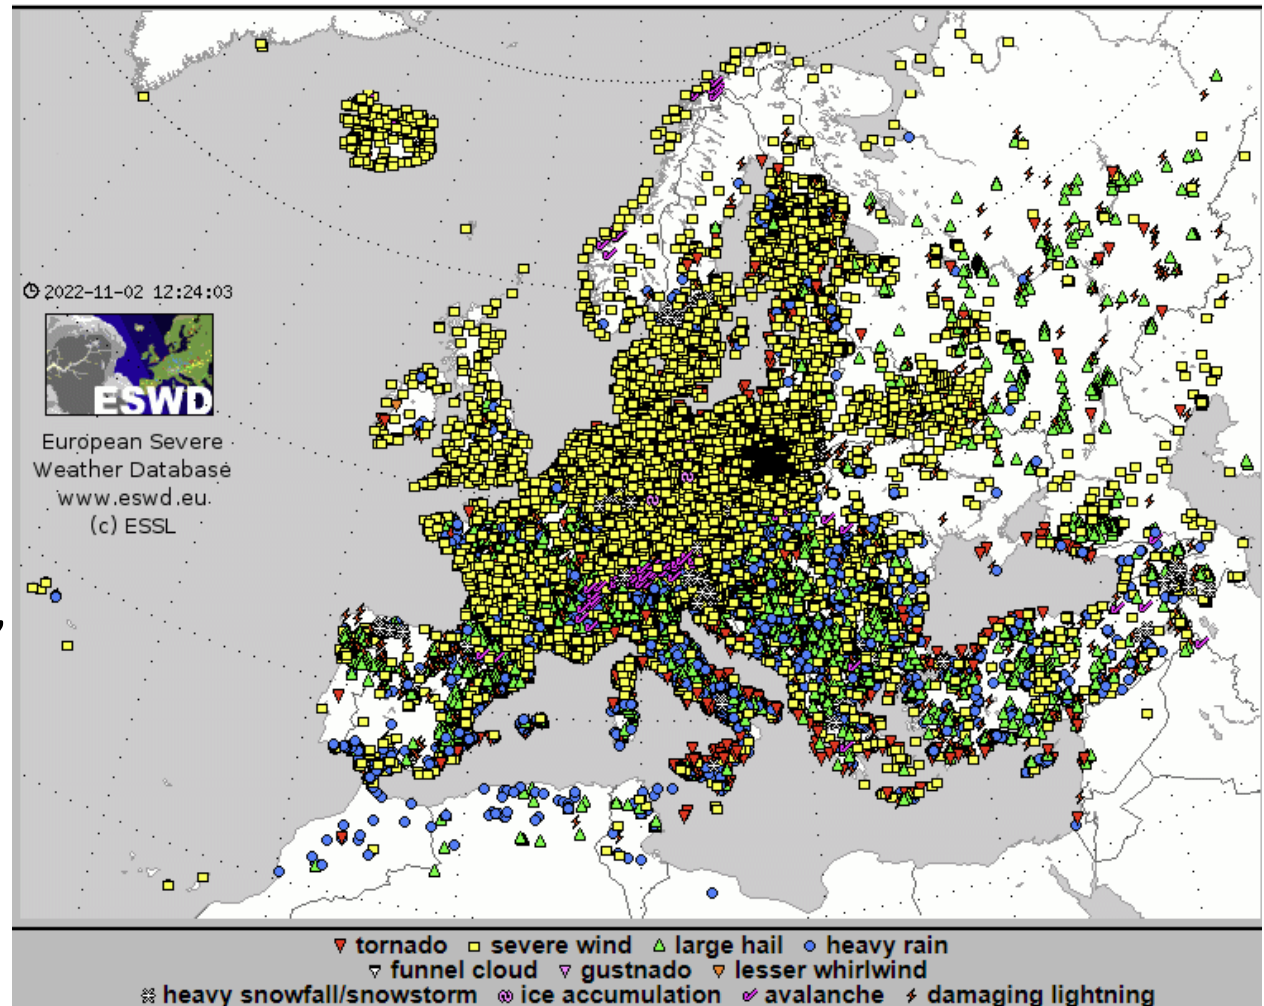

European Severe Weather Database

- Main data sources are trained spotter networks (volunteers) and manually quality-controlled media reports
- **Criterion is severe damage** or severe interruption of daily life (with further definitions)
- Covered event-types:
 - Hail diameter larger 2 cm or hail cover larger 2 cm
 - A severe wind gust measured to have a speed of at least 25 m/s or one doing such damage that a wind speed of 25 m/s or higher is likely to have occurred.
 - Tornadoes
 - Heavy Rain, heavy snowfall and/or snowstorm
 - Ice Accumulations, avalanches
 - Damaging lightning

European Severe Weather Database

- ESWD data for year 2022 to yesterday
- ESWD started in year 2006, but also historical data included

European Severe Weather Database - Users

- In part, ESSL is a service provider to NHMSs and international organizations like EUMETSAT and ECMWF
- The European Severe Weather Database (ESWD) is one of the main reasons to become an ESSL member

Photo: Alois M. Holzer

Grandine in Italia 1950-2020

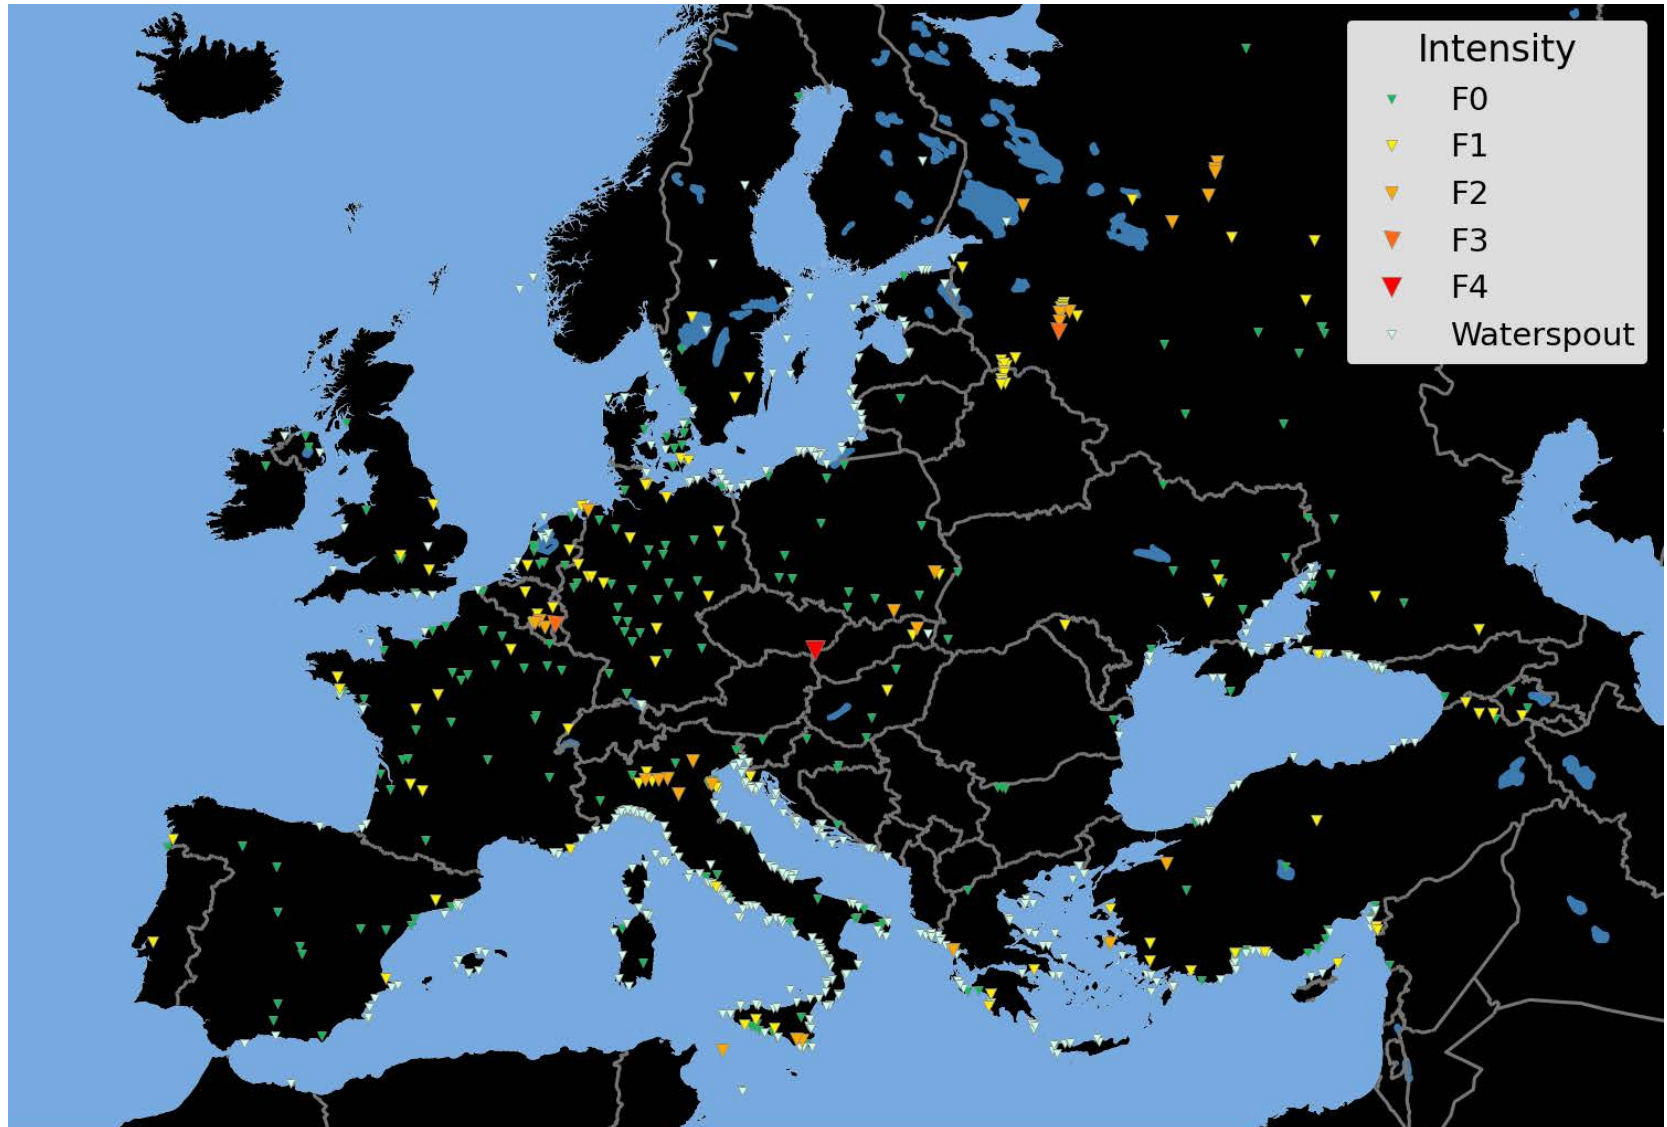

Tornado in Italia 1950-2020

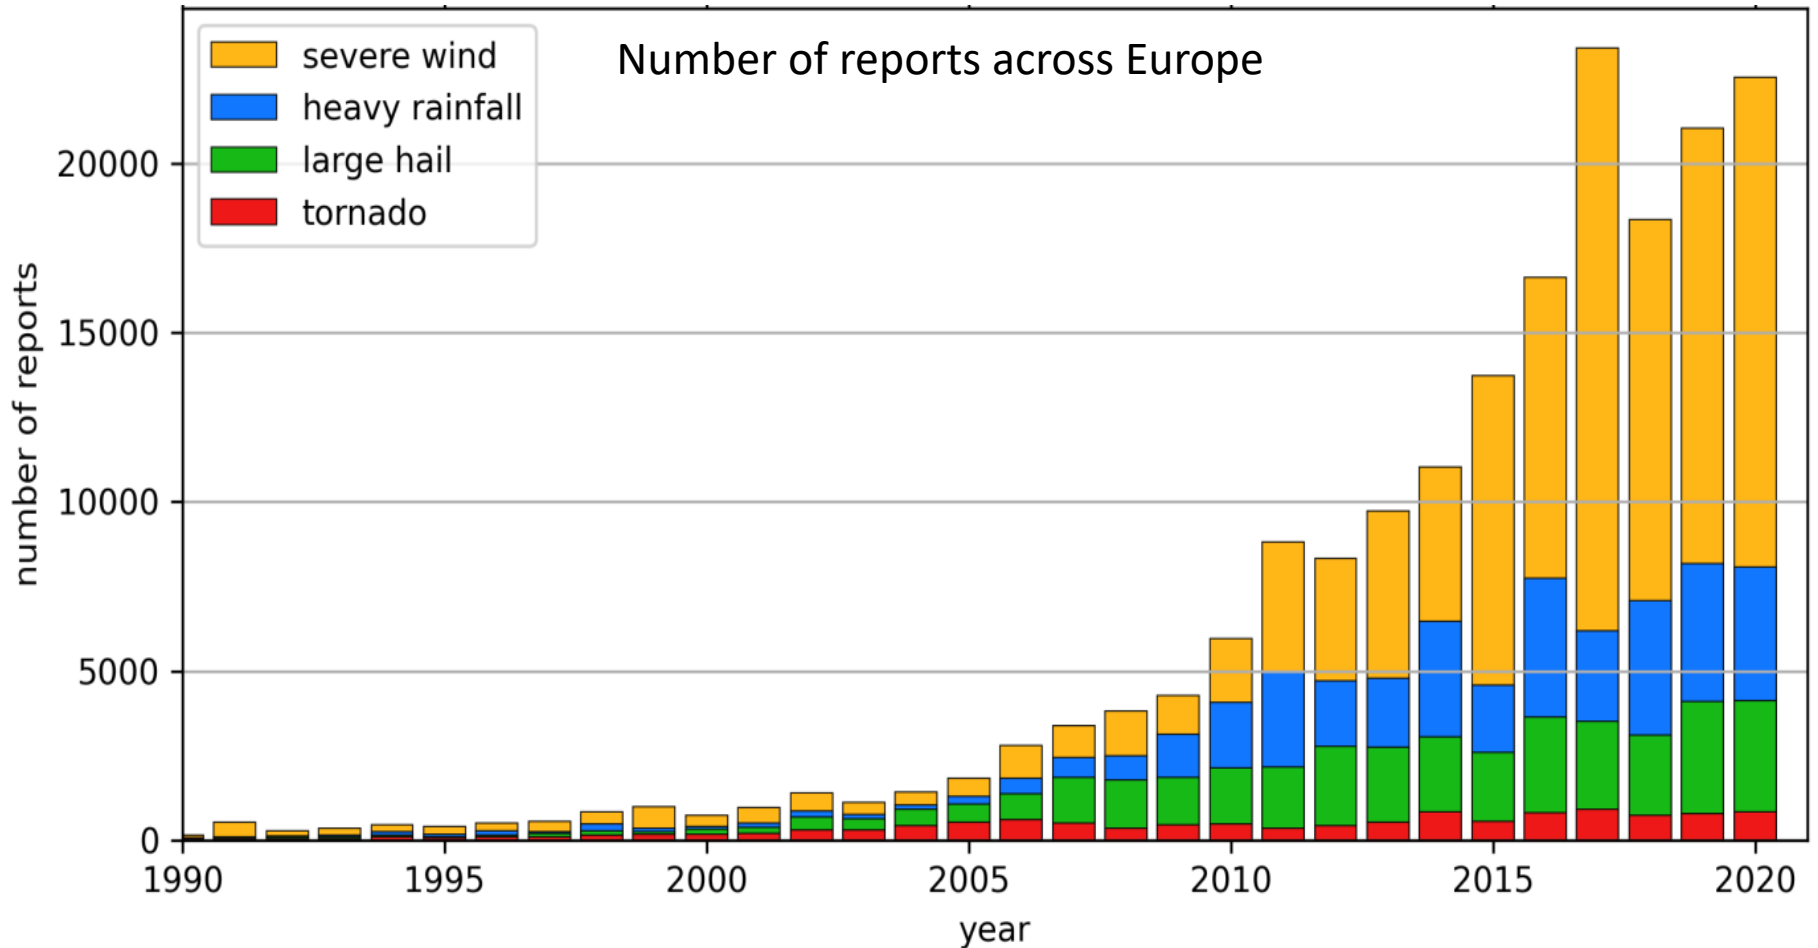

Yearly overviews, example tornadoes 2021

ESWD based severe weather climatology

European Severe Storms Laboratory

Number of reported tornadoes (over land)
in the European Severe Weather Database

European Severe Storms Laboratory

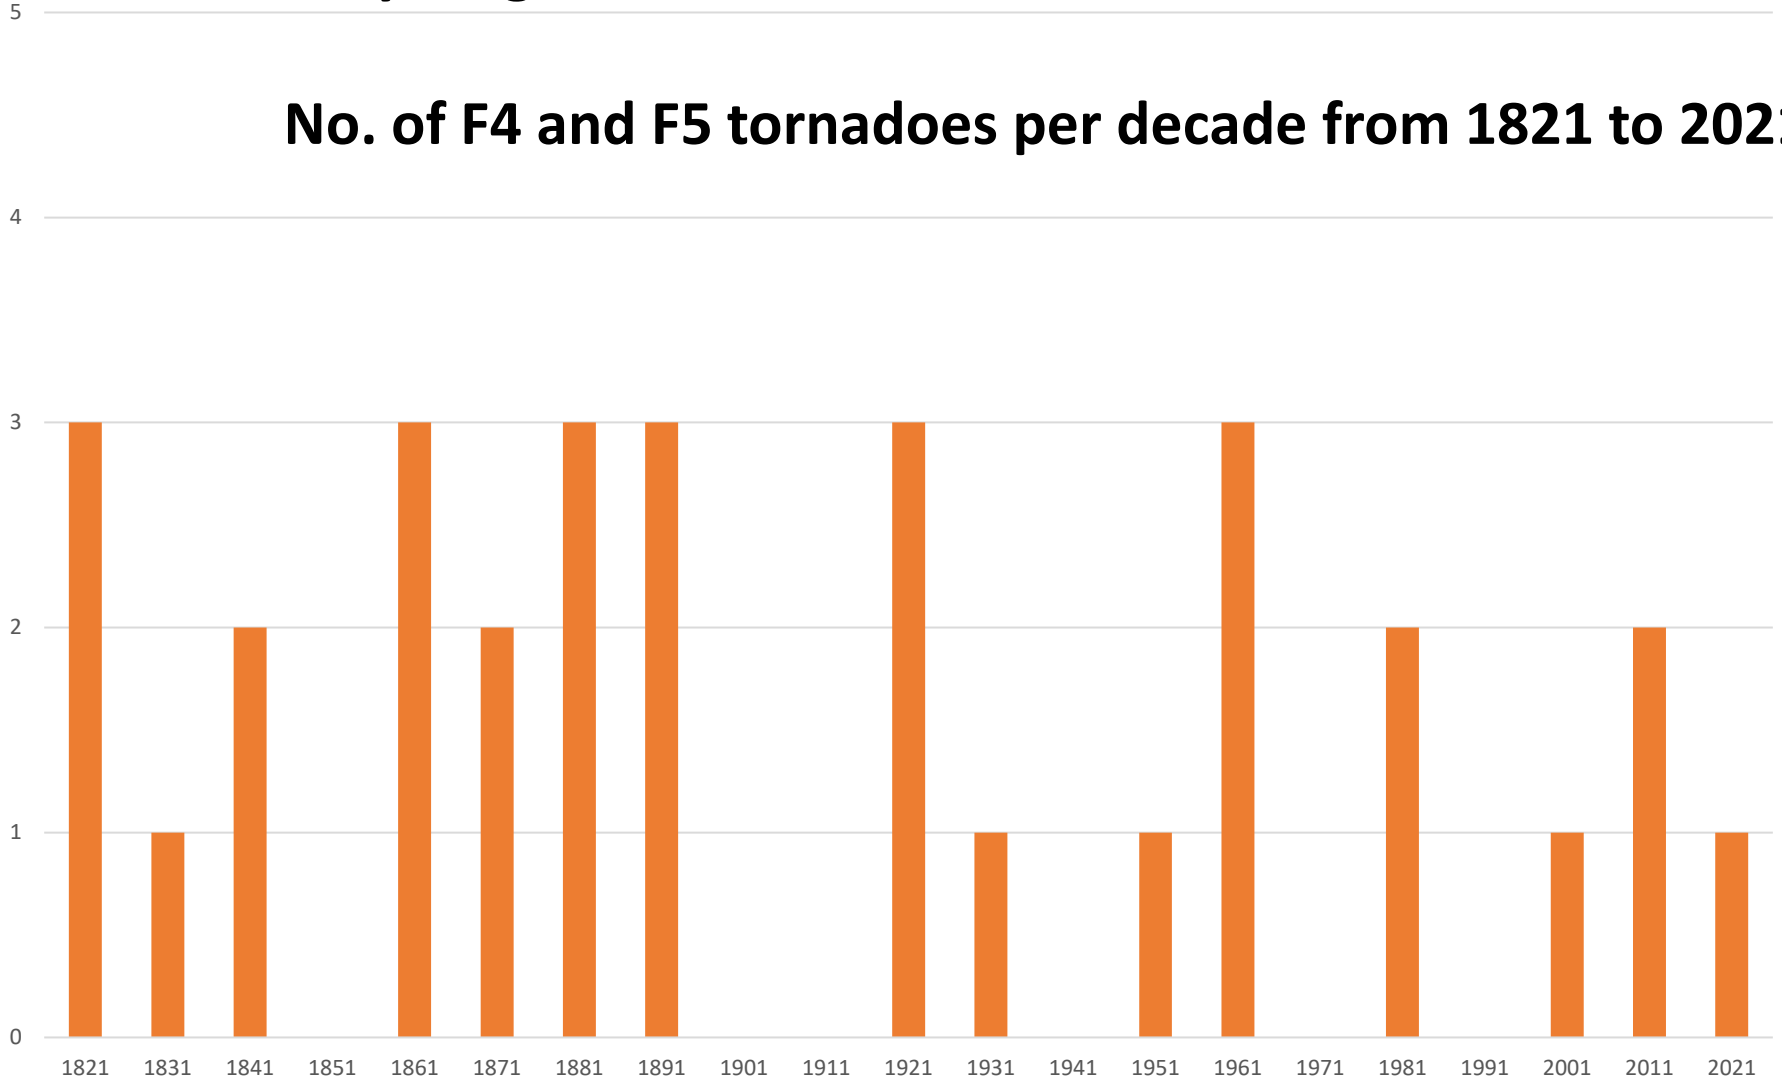

Number of reported significant tornadoes (over land)
in the European Severe Weather Database

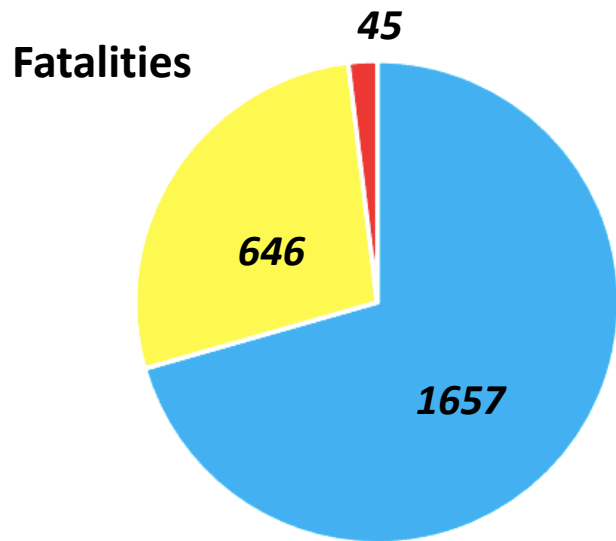

Very long term trends for the most extreme events:

No. of F4 and F5 tornadoes per decade from 1821 to 2021

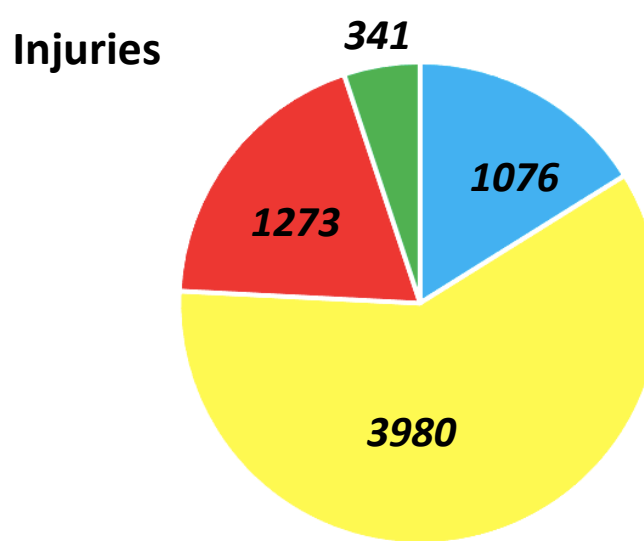

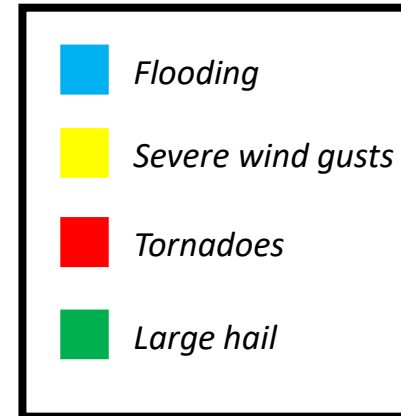

The European Severe Weather Database (ESWD) Societal impacts 2008-2021

Most fatalities: Flooding
118 per year on average

Most injuries: Severe wind gusts
284 per year on average

Database structure ideal for impact studies and warning verification

What was the highest measured wind speed?
Please indicate if there are doubts about the nature of the event.

severe wind
 m/s
 It is possible that this was a tornado

IMPACTS
[More Details](#)

How many persons were injured?

How many persons were killed?

Which impacts occurred?

Transport infrastructure

- Road(s) impassable or closed
- Bridge(s) damaged or destroyed
- Rail-tram-/subway(s) unusable or closed
- Rail-tram-/subway infrastructure damaged
- Rail-tram-/subway vehicle(s) damaged or destroyed
- Airport(s) closed (for more than an hour)
- Aircraft damaged or destroyed
- Ship(s) damaged or destroyed
- Inhabited place(s) cut off from transport infrastructure

Other infrastructure

- Power transmission damaged or destroyed
- Telecommunication infrastructure damaged or destroyed

Damage to homes / buildings

- Damage to roof or chimney
- Roof(s) destroyed
- Damage to window(s) or insulation layer(s)
- Wall(s) (partly) collapsed
- Building(s) (almost) fully destroyed

Damage to road vehicles

- Car(s) damaged (unspecified)
- Car(s) dented
- Car window(s) or windshield(s) broken
- Car(s) damaged beyond repair
- Truck(s) and/or trailer(s) overturned

Damage to trees

- Large tree branch(es) broken
- Tree(s) uprooted or snapped
- Forest(s) damaged or destroyed

Damage to agriculture

- Crops/farmland damaged
- Greenhouse(s) damaged or destroyed
- Animal(s) killed

Event consequences

- Fire as a consequence of the event
- Evacuation order by authorities

2022

Logistic modeling of proxies for large hail based on ESWD data for past and future climates

Training data:
2008-2020 – e.g. Europe

Lightning

Hail ≥ 2cm

ERA5 reanalysis

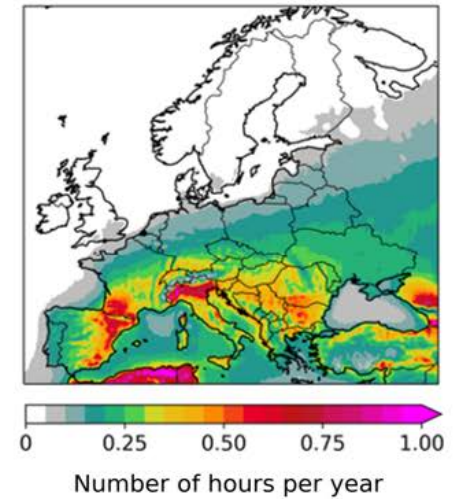

AR-CHaMo
 $P_{hail} = P_{storm} \times P_{hail|storm}$

Fraction of environments with hail ≥ 2cm
(modelled)

Application
1950-2021 – All Europe

Modelled spatial distribution of hail ≥ 2cm (1950-2021)

Past trends in hail ≥ 2 cm (1950-2021)

Number of hours per decade

*Widespread
increases across
most of Europe*

*Highest overall
increase across
Northern Italy*

Past trends in hail ≥ 5 cm (1950-2021)

Number of hours per decade

How rapid is the increase? - Northern Italy

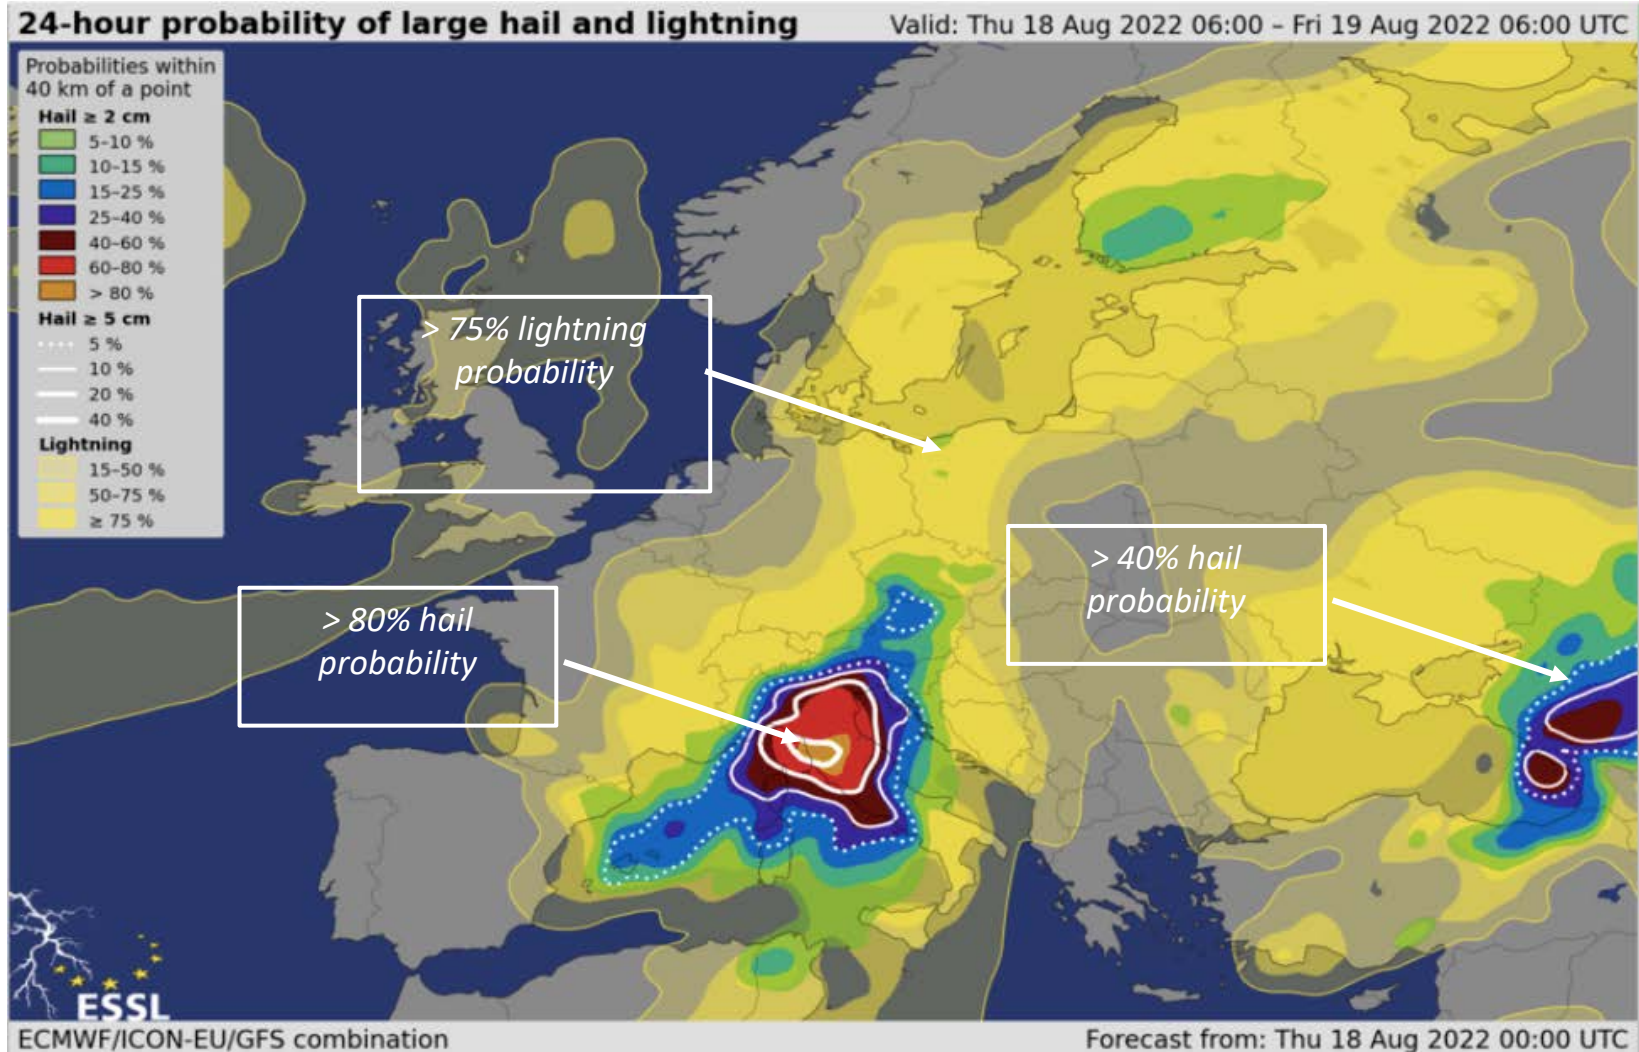

■ *Below average* ■ *Above average*

***Very large* hail is now (2012-2021) 3 times more likely than it was in the 1950s**

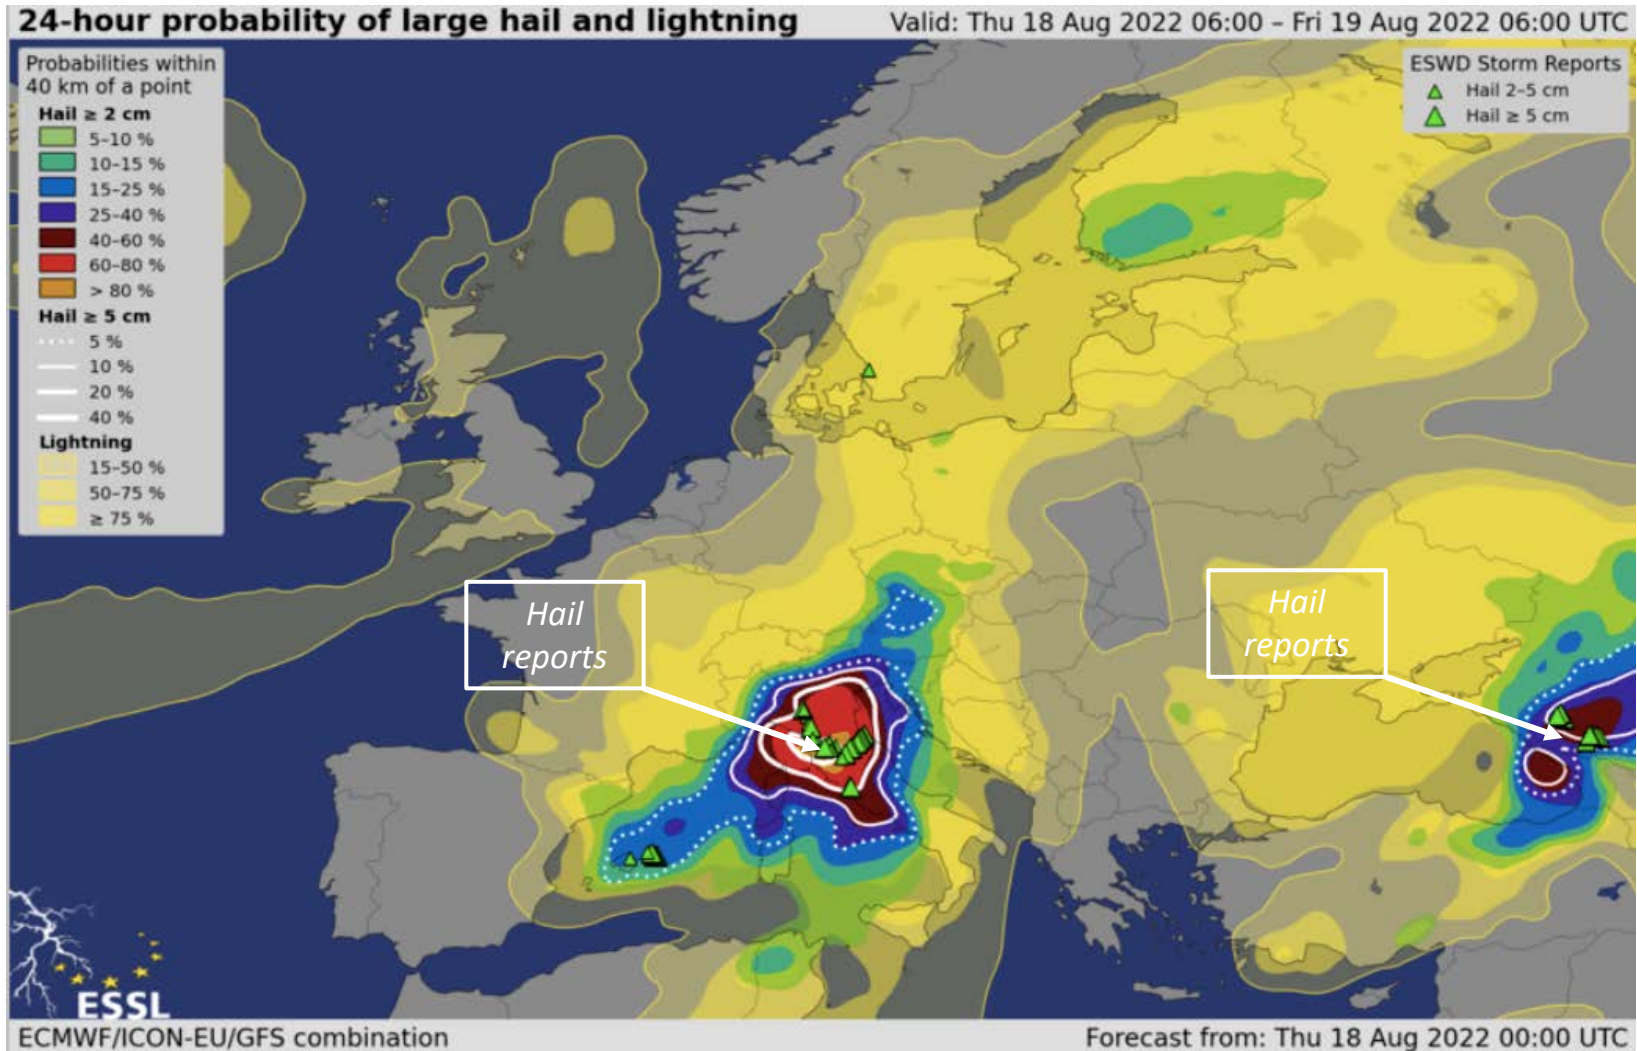

Application to medium-range forecasting

Work within PreCAST, an FWF project in cooperation with ZAMG and ECMWF.

Application to medium-range forecasting

Work within PreCAST, an FWF project in cooperation with ZAMG and ECMWF.

Many scientific papers based on ESWD data

- The ESWD has already been cited 320 times in peer-reviewed scientific literature from around the world: satellite, radar and model studies as well as classic climatology and societal impacts.
- In addition, international institutions (like EUMETSAT and ECMWF) use ESWD data for verification purposes, so do a number of NHMSs (like DWD).

Access to the ESWD

We are happy to also serve your NHMS.

Most straightforward option get permission to use the data:

- Institutional ESSL membership of NHMS, research institute or public authority
- Includes continuous access to the ESWD (all of Europe), which is continuously updated

Contact: alois.holzer@essl.org

www.eswd.eu

Only in 2021 there were 24330 reports:

- **5375** Large Hail (15 per day)
- **5795** Heavy Rain (16 per day)
- **12256** Severe wind (34 per day)
